#### Explanatory Notes

NOTE: Occupational data contained in this publication have been classified according to the Australian Standard Classification of Occupations (ASCO) which was introduced for the August 1986 survey. asco replaced the classification and classified list of occupations (cclo), revised november 1980, used in previous surveys.

The new classification relies on the level and specialisation of skill required to perform primary tasks satisfactorily as its classificatory variable and is therefore significantly different from the previous classification. Detailed information on the ASCO classification and structure is contained in the publication "ASCO Statistical Classification" (Catalogue No. 1222.0).

#### Introduction

This publication contains regional estimates of the Queensland civilian labour force derived from the labour force survey part of the monthly population survey.

Background information on the dissemination of regional labour force statistics is provided in the Information Paper "Release of Regional Labour Force Statistics" (Catalogue No. 6262.0).

Data for each region from October 1982 are available on request.

#### The Population Survey

The survey is based on a multi-stage area sample of private dwellings and non-private dwellings (hotels, motels, etc.) and usually covers slightly more than two-thirds of 1 per cent of the population of Queensland. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during a period of 2 weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

#### Scope

The labour force survey includes all persons aged 15 years and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from Census and estimated populations;
- (c) overseas visitors holidaying in Australia;and
- (d) members of non-Australian defence forces (and their dependents) stationed in Australia.

#### Definitions

The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during the survey week. The following definitions, which conform closely to the international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

Employed persons comprise all those aged 15 years and over who, during the survey week:

- (a) worked for 1 hour or more for pay, profit, commission, or payment in kind in a job or business, or on a farm (including employees, employers, and self-employed persons); or
- (b) worked for 1 hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than 4 weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than 4 weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (d) were employers, self-employed persons, or unpaid family helpers who had a job, business, or farm, but were not at work.

<u>Unemployed persons</u> are those aged 15 years and over who were not employed during the survey week, and:

(a) had actively looked for full-time or parttime work at any time in the 4 weeks up to the end of the survey week and:

### Definitions (continued)

- (i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than 4 weeks to the end of the survey week); or
- (ii) were waiting to start a new job within 4 weeks from the end of the survey week and would have started in the survey week if the job had been available then; or
- (b) were waiting to be called back to a fulltime or part-time job from which they had been stood down without pay for less than 4 weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

Actively looking for work includes writing, telephoning, or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency, advertising or tendering for work; and contacting friends or relatives.

The unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group

Duration of unemployment is the period from the time the person began looking for work or was laid off to the end of the survey week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full-time for 2 weeks or more to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration.

Median duration of unemployment is the duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median and the other comprising persons whose duration is below it.

The <u>labour force</u> comprises all persons who, during the survey week, were employed or unemployed, as defined above.

The labour force participation rate for any group is the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.

Persons not in the labour force are those who, during the survey week, were not in the categories employed or unemployed as defined. This category therefore includes persons who were keeping house (unpaid), attending an educational institution (e.g. school or university), retired or voluntarily inactive, permanently unable to work, inmates of institutions, trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation. Specific surveys of persons not in the labour force indicate that a number of persons want to work but are not classified as unemployed because they were not actively looking for work or were not available to begin work in the survey week. Included in this group are the discouraged jobseekers and other marginally attached to the labour force.

Industry classification. Industry is classified according to the Australian Standard Industrial Classification (ASIC), 1983.

Occupation classification. Occupation has been classified according to the Australian Standard Classification of Occupations (ASCO), 1986.

Regions. Labour force regions are based on statistical divisions or groupings of statistical divisions.

The Brisbane Statistical Division (B.S.D.) Region is divided into the Brisbane City (Inner Suburbs and Outer Suburbs) and Balance of B.S.D. Regions. The Moreton Region is the Moreton Statistical Division; the Wide Bay-Burnett/Darling Downs Region is the Wide Bay-Burnett and Darling Downs Statistical Divisions; and the Fitzroy/Mackay Region is the Fitzroy and Mackay Statistical Divisions.

The North and Western Queensland Region comprises the North-West, Far North, Northern, Central-West, and South-West Statistical Divisions and the North Queensland Region combines the Far North and Northern Statistical Divisions.

The Brisbane Statistical Division comprises the Cities of Brisbane, Ipswich, Logan, and Redcliffe, the Shire of Redland, and parts of the Shires of Albert, Beaudesert, Caboolture, Moreton, and Pine Rivers.

#### Explanatory Notes (continued)

#### Definitions (continued)

Maps delineating the regions are included on pages 5 and 6. A listing of Brisbane City suburbs is contained on page 7.

#### Population Benchmarks

Labour force survey estimates are calculated in such a way as to add to the independently estimated distribution of the population aged 15 years and over by age and sex. This procedure compensates for under-enumeration in the survey and leads to more reliable estimates. Since regular estimates of the population are not available at the regional level, the State benchmarks were used to produce regional estimates. This methodology assumes a common pattern of under-enumeration at the regional level and also ensures that regional estimates add to the State totals.

As regional benchmarks are not used in the estimation procedures, regional estimates of the civilian population aged 15 years and over are not available. Although these figures can be derived by addition they should not be used as they cannot be regarded as being reliable.

#### Reliability of the Estimates

As with other labour force survey estimates, regional estimates are subject to sampling error and non-sampling error. (See Technical Notes pages 21-23.) Since regional estimates for particular labour force characteristics are components of corresponding estimates at the State level, they are subject to higher relative standard errors. As noted above, the use of regional benchmarks in the estimation of regional estimates is not possible.

For these reasons, users should note that regional estimates may be more volatile than corresponding State estimates and thus their use should be restricted to that of providing snapshot information at a given point in time. They should

not be regarded as reliable indicators of shortterm (monthly) movements.

#### Related Publications

Users may also wish to refer to the following publications which are available on request:

"Indicators of Business Activity" (1303.3)

"Monthly Summary of Statistics" (1304.3)

"The Labour Force" (6201.3)

Information Paper "Questionnaires Used in the Labour Force Survey" (6232.0)

Information Paper "Release of Regional Labour Force Statistics" (6262.0)

All publications produced by the ABS are listed in the "Catalogue of Publications" (Catalogue No. 1101.0) which is available from any ABS Office.

#### Unpublished Statistics

The ABS can also make available certain regional labour force statistics which are not published. Where it is not practicable to provide the required statistics by telephone, they may be available in other forms, such as microfiche, photocopy, computer printout, or clerically extracted tabulation. A charge may be made for providing unpublished statistics in these forms.

For further information on these unpublished statistics contact Bevin Morris by telephoning Brisbane (07) 222 6029, or write to Information Services at the address above.

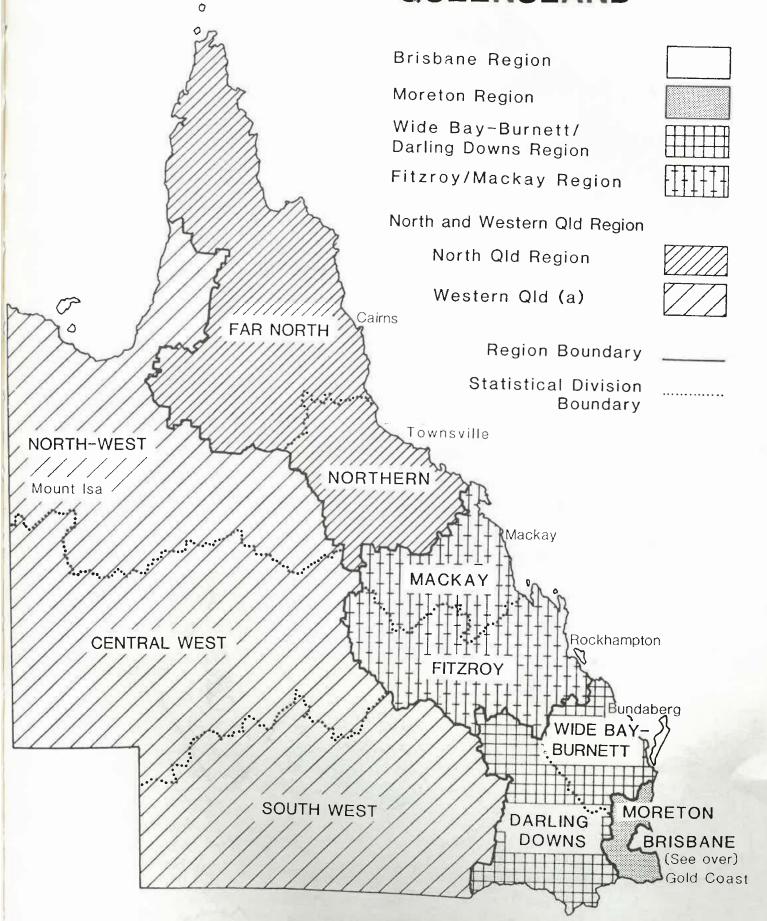

#### Symbols and Other Usages

- .. Not applicable.
- \* Subject to sampling variability too high for most practical uses. (See Technical Notes pages 21-23 regarding reliability of the estimates.)

Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

#### Estimation Procedure

The labour force estimates are derived from the monthly population survey and are calculated in such a way as to add to the independently estimated distribution of the population aged 15 years and over by age and sex. This procedure compensates for under-enumeration in the survey and leads to more reliable estimates.

Since regular estimates of the population are not available at the regional level, the State benchmarks were used to produce regional estimates. This methodology assumes a common pattern of under-enumeration at the regional level and also ensures that regional estimates add to the State totals.

#### Reliability of the Estimates

As with other labour force survey estimates, regional estimates are subject to sampling error and non-sampling error. Since regional estimates for particular labour force characteristics are components of corresponding estimates at the State level, they are subject to higher relative standard errors. As noted above, the use of regional benchmarks in the estimation of regional estimates is not possible.

For these reasons, users should note that regional estimates may be more volatile than corresponding State estimates and thus they should not be regarded as reliable indicators of short-term (monthly) movements.

The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, the estimates and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included and about 19 chances in 20 that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the relative standard error.

Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates and monthly movements should be determined by using Tables A and B.

The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

As the standard errors in Table A show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates below the levels shown in Table A, and percentages based on such estimates, have not been included but are indicated by \*. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable. See text below concerning the higher publication cut-off point for estimates of median duration of unemployment.

The movement in the level of an estimate is also subject to sampling variability. standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. Standard errors of monthly movements are given in Table B. The estimates of standard error of monthly movements apply only to estimates of movements between consecutive months. two between corresponding months Movements consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements), and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in Table B. Standard errors of quarterly movements can be obtained by multiplying the figures in Table B by 1.4. Standard errors of all annual movements can be obtained by multiplying the figures in Table A by 1.4. When using Table A or Table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

Examples of the calculation and use of standard errors are given in the ABS publication "The Labour Force" (Catalogue No. 6201.3).

<sup>(</sup>a) Regional estimates smaller than those shown in this table are not published.

#### Technical Notes (continued)

#### Reliability of the Estimates (continued)

The relative standard errors of estimates of median duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by 2.0. The publication cut-off point for estimates of median duration of unemployment is 10,800 persons.

The imprecision due to sampling variability, which is measured by the standard error, should

not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in the recording and coding of data, and errors made in the processing of data. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and efficient operating procedures.
